

FRISKER^{PRO}

HAND WORN METAL DETECTOR

Revolutionary Patented Device That is Worn on Your Hand

Manufactured by Paradigm Tactical Products, Inc.

- *Will enhance officer safety.
- *Developed by ex-law enforcement professionals.
- *Point specific sensor, negates re-bar false positives.
- *Conforms with Electro Magnetic Interference (EMI).
- *Can fit all hand sizes: male or female, left or right hand.
- *Conforms with National Institute of Justice Standards (NIJ).
- *Alerts user of metal detection (not the suspect) by vibrating.
- *Weights 2.2 ounces (w/ out battery) only 4 inches in length.
- *Early low battery indicator, provides 3 months of normal use.
- *Replaceable 9 volt battery, no tools needed to change battery.
- *Visit www.Frisker.com for a 5.34 minute video demonstration.
- *Can detect a safety pin or staple concealed in a prisoner's mouth.
- *Reverse sensor for male searching female approved search protocol.
- *Frees hands and fingers to perform academy approved search techniques.
- *Secure factory settings, simply slide the FriskerPRO[®] on and begin search.
- *FriskerPRO[®] can be used in all weather conditions: splash & salt water resistant.

"We bought 60 FriskerPRO[®]'s. We issued them to all our police officers. In Saugus we have a lot of night clubs and we have a lot of gang members that come out of Boston, Lowell or Lawrence to frequent these night clubs. We take weapons off these subjects. This (FriskerPRO[®]) is a LIFESAVER because a lot of knives and guns have been found using the FriskerPRO[®]. We love 'em!" Lt. Ronald Whiten, Saugus PD

"The FriskerPRO[®] is a SURVIVAL TOOL. Once you have seen it work you will see what it can detect which normally you would not find. It is not cost prohibitive, we spend more money on coffee in a month than we spent on this tool. It will save your life." Officer Bruce Klinger, Boxford PD

"It is imperative never to be deviated from a thorough pat down no matter the age, sex or clothing of a subject as shown in the pat down of a young man wearing baggy pants. A cursory pat down by Cincinnati officers missed the gun secreted between his legs in the pants which led to a shoot out in which, amazingly, no one was wounded. The results could have been vastly different for the subject and the officers involved. Your department may wish to check out the FriskerPRO[®] to assist in pat downs. It is a metal detector that an officer literally wears on his/her hand. It keeps hands and fingers free to search the subject using academy approved techniques. You can learn more about the FriskerPRO[®] on our website www.lineofduty.com." Edged Weapons

FriskerPRO® Hand Worn Metal Detector
Enhancing Officer Safety Every Day
Manufactured by Paradigm Tactical Products, Inc.

**Patented
Technology**

The FriskerPRO® is a **highly sensitive** unit that, when used properly, can readily detect both ferrous and non-ferrous objects such as guns, knives, ice picks, razors, etc.

The silent pulsating feature of the FriskerPRO® alerts only the officer of the detected metal. **In most instances the suspect will be unaware you are using a metal detector.**

Creating the FriskerPRO®

In today's world where heightened tensions affect law enforcement and counter-terrorism operations, field operatives need equipment that reduces the uncertainty and risk associated in the course of conducting a pat-down search. The FriskerPRO® is the only hand worn metal detector which solves this problem

A hand worn metal detector that fits into the palm of the hand and is used to **enhance** the Police Academy standard "pat down" search technique.

The FriskerPRO® is worn like a glove and **improves** upon the police pat-down search technique, by eliminating direct contact with the suspect.

No other metal detector can be physically / literally worn.

Discreet vibration alerts user of metal detection and not the suspect.

Reverse sensor for male searching female approved search protocol.

Frees hands to take counter measures should the subject require immediate **restraint**, without having to discard the device.

Unlike traditional 'wand' detectors, the FriskerPRO® **allows** officers to retain full use of their hands, **improving** the officer's ability to **respond** to events as they unfold.

- * Powered by **replaceable** 9 volt battery provides 3 months of normal use
- * Early low battery indicator **no tools** needed to change the battery
- * Use in **ALL** weather conditions splash and salt water resistant
- * Ready to **USE secure** factory settings, slide the FriskerPRO® on your hand, turn on, begin to search.

It is the only metal detector of its kind which is mounted on the back portion of either hand, or over a tactical glove.

This unique feature gives the officer the **safety advantage** of being able to use **both** of their hands in the event they have to draw and use their weapon.

The Beginning

As a retired **LAPD detective** with 26 years experience, I have often wondered why more technological advances are not being developed to assist law enforcement officers and make their dangerous profession safer

Police officer's **safety** is the number one priority of every law enforcement agency. We all receive intensive training on how to stop, approach, and search suspects. Despite this intensive training, many police officers are shot and killed every year.

During my career I have searched thousands of suspects and have found numerous weapons and contraband. I often think of how many weapons I may have **MISSED** during these searches which could have cost me and my partner our lives.

When Bauman and Bernstein initially showed me their new hand-held metal detector, I asked them if it could possibly **designed to mount** on the back of the hand.

Missing Contraband

I vividly recall doing a pat-down search of a gang member and because he was wearing a large bulky jacket, I missed finding a .22 cal. Revolver he had inside his waistband. Lucky for me, my partner did a follow-up search and found the gun!

The other incident occurred when I picked up a common drunk and transported him to our jail. During the booking process, the booking officer discovered the arrestee had a .25 cal. auto inserted barrel first into his rectum and secured with tape across the cheeks of his buttocks.

FriskerPRO® Operations

The FriskerPRO® **operates** with pulsating vibrations equivalent to those received on a standard communication pager. These pulsations occur only when the concealed object is located. Other hand held metal detectors utilize warning lights that fade out in the bright sunlight or have buzzers that are difficult to hear.

The microprocessor and the battery are attached to the backside of the hand by an **adjustable** elastic strap. The coil/sensor of the unit is positioned so that it aligns to the center portion of the palm of the hand. The microprocessor and the coil/sensor are the primary components of the FriskerPRO® together they **can sense all** ferrous and non ferrous metals over which the palm passes.

Former detective, Dovideo, immediately realized the same high tech microprocessor technology used in this treasure hunting probe could be converted into a hand mounted, battery operated metal detector.

He observed that this **unique** device could be utilized by **law enforcement officers, private security officers, emergency medical personnel**, etc., who routinely deal with suspected **criminals** and conduct searches for **concealed weapons** and contraband. Together we designed and developed the FriskerPRO®.

The FriskerPRO® metal detector, can be worn on either hand and would make it possible to **safely locate** a concealed, dangerous weapon before it could be used to cause bodily injury or death.

Dovideo, former Los Angeles Police Officer of 26 years. "I vividly recall two separate occasions where not finding a concealed gun could have cost me and my partner our lives and had a second follow-up search not been conducted."

With the **invention** of the FriskerPRO® this type of concern will be greatly **lessened** because it will afford the ability to **literally transform** the hand into a metal detector.

When the device is **activated** by turning on the switch, it will immediately **pulsate twice** to indicate the unit is functioning properly. The searching process can then begin. The reliability of this electronic devices is now totally dependent upon the technique of the user. The user must conduct a thorough, systematic search of the suspect's person. If the search is properly conducted, the likelihood of a metal weapon not being located is highly improbable.

To use the FriskerPRO®, it is important that you perform the search in exactly the same manner as you were trained by your department or agency. The unit will detect metal over which the sensor passes. The FriskerPRO® will provide you with that **extra measure of assurance** that no weapons and contraband are missed.
